

grnd_truth: The word the user is supposed to write
select: The word selected by the user
err (1/0): 1 if an error occurred (time-out error or if select is not equal to grnd_truth
iter: The total number of alphabet-sequence repetitions (scans) to select the word
citer: The number of alphabet-sequence repetitions (scans) where the user clicked
nundo: The number of times the user clicked 4 or more times to restart a letter selection
chr_thr (seconds): The time it should take to read one alphabet sequence (scan)
chr_time (seconds): The measured time it took to read one alphabet sequence (scan)
delay (seconds): The delay at the end of an alphabet sequence to wait for last clicks
wpm_min (words/min): The min time it could to write the word take with an efficient implementation
wpm_theory(words/min): The min time it could to write the word take with an efficient implementation, including the end delay
wpm (words/min): The measured time it took write the word
tot_time (seconds): The total time it took to write the word (corresponding to wpm)
cpc: The average number of clicks per character used to write the word, word length=5
%error: %of word length that was wrong after the word selection
over (a number between 0 and 1): Sound overlap between adjacent letters (speed setting)
speed (words/min): The sound overlap (speed setting) expressed as wpm
nclicks: The total number of clicks to select the word.
