grnd_truth: The word the user is supposed to write

select: The word selected by the user

err (1/0): 1 if an error occured (time-out error or if select is not equal to $grnd_truth$

iter: The total number of alphabet-sequence repetitions (scans) to select the word

citer: The number of alphabet-sequence repetitions (scans) where the user clicked

nundo: The number of times the user clicked 4 or more times to restart a letter selection

chr_thr (seconds): The time it should take to read one alphabet sequence (scan) chr_time (seconds): The measured time it took to read one alphabet sequence (scan)

delay (seconds): The delay at the end of an alphabet sequence to wait for last clicks

wpm_min (words/min): The min time it could to write the word take with an efficient implementation

wpm_theory(words/min): The min time it could to write the word take with an efficient implementation, including the end delay

wpm (words/min): The measured time it took write the word

tot_time (seconds): The total time it took to write the word (corresponding to wpm)

cpc: The average number of clicks per character used to write the word, word lenghth=5

%error: %of word length that was wrong after the word selection

over (a number between 0 and 1): Sound overlap between adjacent letters (speed setting)

speed (words/min): The sound overlap (speed setting) expressed as wpm

-		ber of clicks		-	-	essea	as wpi	ш
